Evening Brief

Date: June 9th, 2021

Weather Summary:

... Stronger Winds Today with low RH continue across NV and UT shifting east in UT Thursday ...

... Temperatures are significantly cooler over the north and west this week compared to last weekend with cooler weather all areas Thursday before warming...

A low pressure system along the Pacific coast is keeping strong southwest winds in place over Southern and Eastern Idaho, Nevada, Utah and the Arizona Strip again today with gusts 35mph+ and RH 8-15%. Stronger gusts are expected today over South Central and Eastern Nevada into far Western Utah with gusts 45-55mph. Gusty Southwest to West winds continue on Thursday over central and eastern Utah ahead of the cold front. Winds diminish regionwide on Friday. *See the forecast matrix for **High Risk** for winds/RH today and Thursday.*

The low moves inland on later today and will move over the northern half of the Great Basin on Thursday. This will bring **widespread showers** and even colder temperatures to North Central Nevada and Western and Central Idaho beginning this evening and continuing through Thursday. Areas of wetting rain are expected within this region. Showers will remain more scattered Thursday over Eastern Idaho into Wyoming. Cooler temperatures spread east and south across much of the Great Basin, including Utah on Thursday.

High pressure begins to rebuild Friday into the weekend and really strengthens next week. Temperatures return to normal/above normal for the weekend and 10-20 degrees above normal again next week, with potential record heat again for Utah and the Arizona Strip.

Preparedness Levels & Great Basin Fire Activity (from WFDSS)

Great Basin	PL 2	Light Initial Attack Activity
National	PL 2	New Fires and Acres: fires for acres / acres Large Fire Growth

Fuels/Fire Potential:

Green up is winding down across the Great Basin, and fuels are curing over northern areas, especially with recent hot and dry conditions. Fire activity will still be somewhat reduced in the north until fuels completely cure, especially with incoming moisture Wednesday night and Thursday. Due to the dry winter and spring in the lower elevations, some areas with a carryover grass component in the north may still be susceptible to fire spread during windy periods. The modest green-up has ended over southern areas...which have already returned to critically dry levels.

Gusty winds this week after very hot and dry conditions will continue to rapidly decrease fuel moisture across Nevada, Utah and the Arizona Strip and parts of Southern Idaho and also increase fire potential. Exceptional drought continues over the southern half of the Great Basin for increased

threats of ignitions and fire spread, along with unusual fire behavior for the time of year in especially the larger fuels at mid-high elevations.
